Agent Vera: catching delinquency before day 30

A Data 360 and Agentforce prototype, with policy enforced in the collections system

Prasenjit Choudhury · Panel presentation · 23 October 2026

THE PROBLEM

Account delinquency is on the rise, and before day 30 is the cheapest place to stop it

CREDIT UNIONS NATIONALLY

0.96%

of loans 60+ days late in Q2 2026, up from 0.90% a year earlier

AT MY FAVORITE CU, EVERY MONTH

4% of members fall 1–29 days late

80% of them cure before day 30

20% roll past 30 days, where losses start

Today each one costs a collector contact: about $7 fully loaded for an 8–10 minute call.

Source: NCUA, Q2 2026 credit union system performance data (delinquency = 60+ days). Credit-union rates: My Favorite CU baseline.

EXECUTIVE RECOMMENDATION

Launch Vera as a self-serve cure channel for members 1–29 days late

Owner

VP of Collections, accountable for the roll rate.

With Member Services, Compliance and the Salesforce team.

Measurable outcome

Roll rate from 1–29 to 30+ days late, against a random holdout group on today's process. Baseline 20%.

Also: self-serve rate, cost per cure. Guardrail: zero wrong-person disclosures.

Prototype · done
Built and tested on Agentforce with a live policy API

→

Pilot · 8–12 weeks
A random part of the segment stays on today's process for comparison

→

Scale
Only when the exit conditions are met

PATH TO VALUE

Two levers: contacts saved and accounts kept out of 30+ days delinquency

ILLUSTRATION · PER 100,000 MEMBERS, MONTHLY

Today	Count
Members 1–29 days late	4,000
Cure before day 30 (80%)	3,200
Roll past 30 days (20%)	800
Collector cost, one $7 contact each	$28,000

40 fewer rolls

for every point off the roll rate (20% to 19%)

$7 or more saved

for every cure that needs no collector

Not modeled yet: the dollar value of an avoided roll (needs balance and loss data) and Vera's cost per conversation.

ARCHITECTURE

How does it all work?

DATA 360

Who to contact

Unifies core, collections and digital profiles. Builds the consented SMS segment.

AGENTFORCE

Vera talks

Verifies, explains, captures the member's choice, hands off. Decides nothing.

COLLECTIONS API

Policy decides

Off-platform system of record. Quotes live amounts, re-checks every write.

SERVICE CLOUD

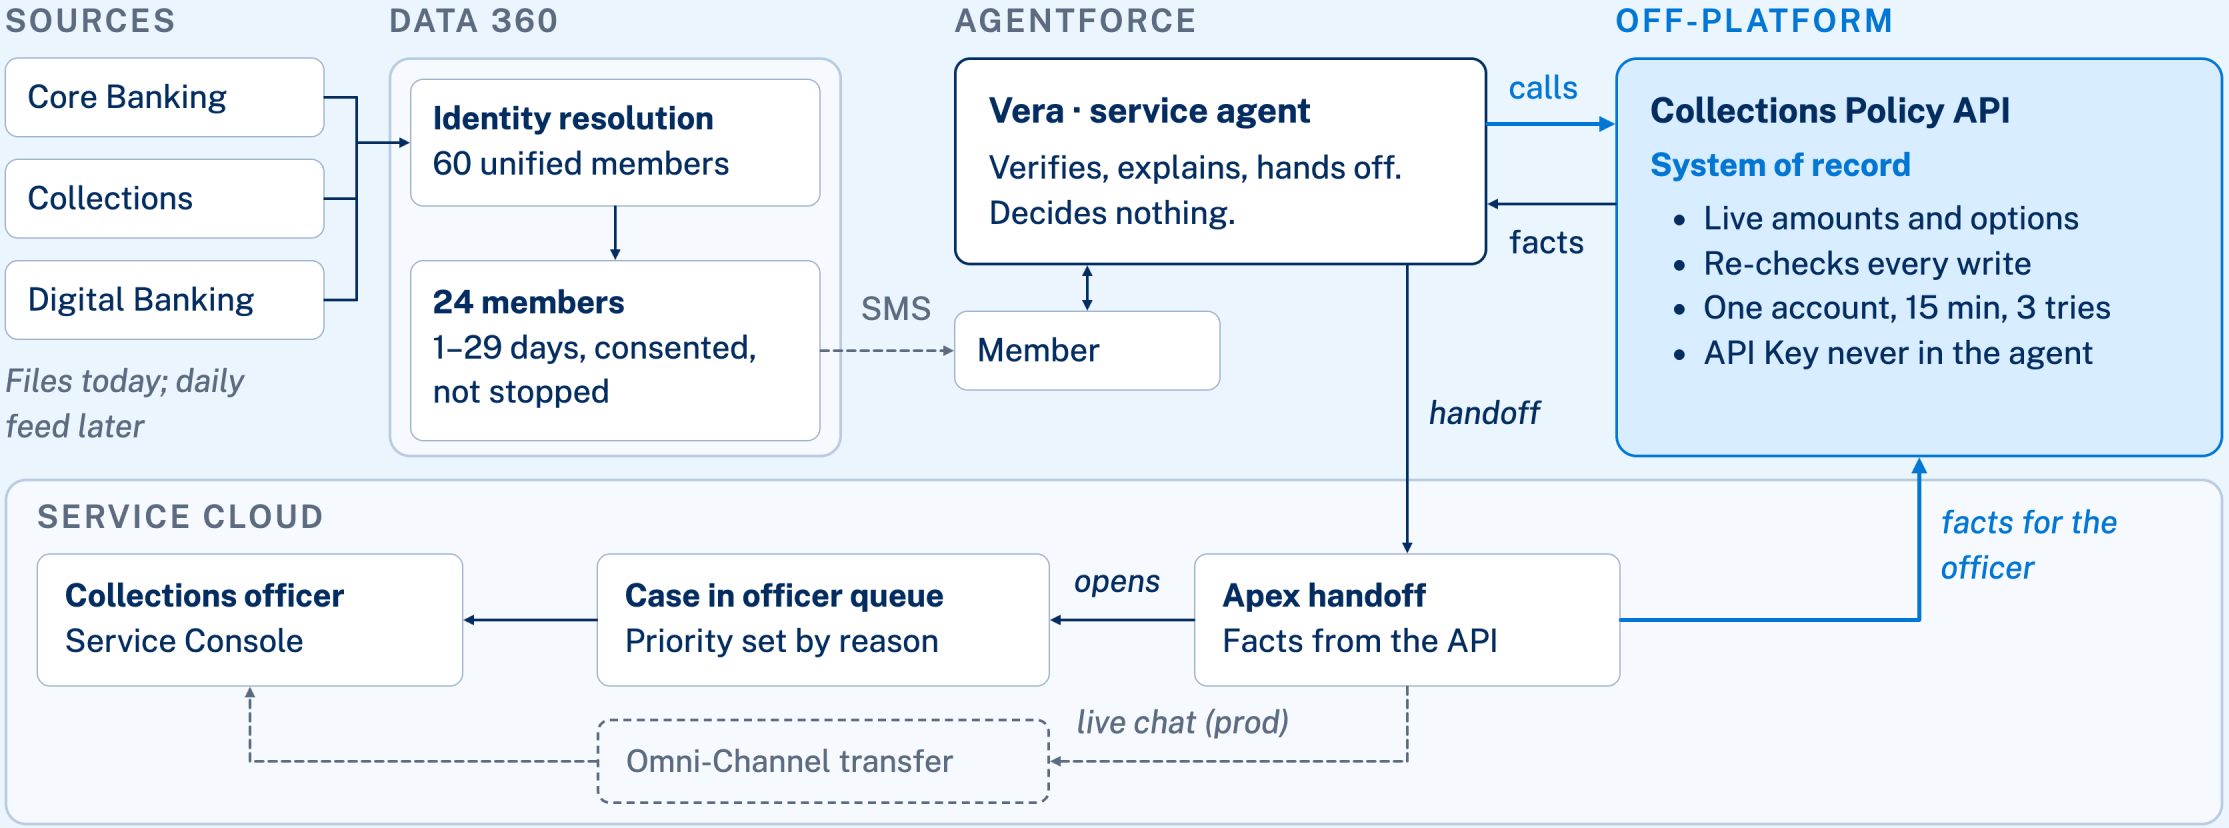

Officer case

On handoff: a queued case with facts from the API and the member's words.

Built and tested: everything above. Designed, not built: SMS sending and the live Omni-Channel transfer. Full diagram on the next slide.

ARCHITECTURE · FULL DIAGRAM

The full flow, and who decides what

Solid: built and tested · Dashed: designed, not built · Blue: where policy is enforced

THE MATERIAL UNCERTAINTY

Can an AI agent be trusted to offer only what policy allows and never disclose a debt to the wrong person?

Simple answer: don’t trust the prompt. Enforce the rules in the system of record, then test the agent against them.

TECHNICAL VALIDATION

Tested live, failures found, fixed and tested again

35/36

Testing Center, live API, after fixes

5

real defects found in run 1, including a prompt injection

36

API tests: verification, lockout, policy, retries

3/3

handoff tests, including the API down

The platform's AI judge passed 3 replies that broke the policy. Every reply was read by a person.

Inspect: GitHub repo (API, agent script, Apex, tests) · both Testing Center runs in the org · API audit log · officer cases 00001026–29

DEFENSIVE ANALYSIS

Discarded alternatives

Alternative	Rejection reason	Accepted cost
Policy in the prompt or a knowledge article	An AI can be argued out of a rule. In run 1 a fake “policy update” got an out-of-policy offer.	An API call on every turn
Eligibility rules built in Salesforce	Duplicates the collections system. Staff, phone and agent should ask one source of truth.	One integration to run; replies take about 6 s
Quote balances from Data 360	Data 360 holds a daily snapshot. A stale amount quoted to a member is a compliance risk.	Data 360 targets; it never quotes money
Live chat transfer in the prototype	Standard setup with high demo risk. The case already carries the context.	Designed for production, not built
Voice as the first channel	Members in delinquency often prefer to act privately. A text message is less intrusive. Voice needs its own consent and costs more.	Voice moves to phase 2

EXECUTION HANDOFF

What the build team inherits

Who owns what

Owner	Owns
VP of Collections	The outcome, the policy rules, go or no-go
Compliance	Consent rule, scripts, collection-law review
Member Services	Officer queue, response times, training
Salesforce team	Vera, Data 360 segment, Omni-Channel
Core system owner	Policy API on the real system of record

Open questions · answered before Gate 1

1. Real promise window, fees and plan limits (illustrative today) · VP of Collections
2. Which source wins when SMS consent conflicts · Compliance
3. Payment-link provider for “pay now” · Member Services
4. Agentforce cost per conversation against the $7 contact · Salesforce team
5. Does the core system expose eligibility, or do we build it? · Core system owner

EXIT CONDITIONS · PROPOSED

Two gates and one stop rule

Gate 1 · start the pilot

- Zero wrong-person disclosures and zero out-of-policy offers across 200+ full test conversations
- Real policy numbers signed off
- Compliance sign-off
- Live transfer working, transcript on the case
- 9 in 10 replies under 5 seconds

Gate 2 · scale

- Roll rate lower than a random holdout group on today's process, over two monthly cycles
- Complaints and opt-outs no higher than the holdout
- Cost per cure below the $7 contact

Stop rule

Any disclosure to the wrong person pauses the pilot until the cause is fixed and re-tested.
